

Inheritance and Lookup

2: Lookup

Damien Cassou, Stéphane Ducasse and Luc Fabresse

W4S02

<http://www.pharo.org>

Goal

- Understanding
 - message sending
 - method lookup
 - semantics of `self`

Inheritance

- Inheritance of state is static
- Inheritance of behavior is dynamic

Message Sending

Sending a message is a two-step process:

1. **look up** the **method** matching the message
2. execute this method on the **receiver**

Method Lookup

The lookup starts in the **class** of the **receiver** then:

- if the method is defined in the class, it is returned
- otherwise the search continues in the superclass

Some Lookup Cases

Sending the message `color`
to `aColoredRectangle`

Some Lookup Cases

Sending the message `area`
to `aColoredRectangle`

self Always Represents the Receiver

```
A new foo
```

```
> ...
```

```
B new foo
```

```
> ...
```

self Always Represents the Receiver

A new foo
> 10
B new foo
> 50

What is self/this?

Take 5 min and write the definition of self (this in Java).

- your definition should have two points:
 - what does `self` represent?
 - how is a method looked up when a message is sent to `self`?

self/this

- `self` represents the receiver of the message
- `self` in **Pharo**, `this` in **Java**
- The method lookup starts in the class of the receiver

self Always Represents the Receiver

```
A new bar  
> ...  
B new bar  
> ...
```

self Always Represents the Receiver

A new bar
> 10
B new bar
> 50

self Always Represents the Receiver

B new bar
> 50

Evaluation of `aB bar`

1. `aB`'s class is **B**
2. no method `bar` in **B**
3. look up in **A** - `bar` is found
4. method `bar` is executed
5. `self` refers to the receiver `aB`
6. `foo` is sent to `self`
7. look up `foo` in the `aB`'s class: **B**
8. `foo` is found there and executed

self Always Represents the Receiver

A new bar
> ...
B new bar
> ...
C new bar
> ...

self Always Represents the Receiver

A new bar
> 10
B new bar
> 10
C new bar
> 50

What You Should Know

- `self` always represents the receiver
- Sending a message is a two-step process:
 1. Look up the method matching the message
 2. Execute this method on the receiver
- Method lookup maps a message to a method
- Method lookup starts in the class of the receiver
 - ...and goes up in the hierarchy
