

Understanding the Implementation of `ifTrue:ifFalse:`

Damien Cassou, Stéphane Ducasse and Luc Fabresse

W6S02

<http://www.pharo.org>

Yes ifTrue:ifFalse: is a message!

```
Weather isRaining  
  ifTrue: [ self takeMyUmbrella ]  
  ifFalse: [ self takeMySunglasses ]
```

- Conceptually ifTrue:ifFalse: is a message sent to an object: a boolean!
- Heavily optimised by the compiler

Exercise

- Propose an implementation of `ifTrue:ifFalse:`
- You only have objects, messages and closures

```
false ifTrue: [ 3 ] ifFalse: [ 5 ]  
→ 5
```

```
true ifTrue: [ 3 ] ifFalse: [ 5 ]  
→ 3
```

Implementing ifTrue:ifFalse:

- Remember:
 - [] freezes body execution
 - value kicks execution of a frozen code
- How to implement ifTrue:ifFalse:?
- Remember Not and Or?

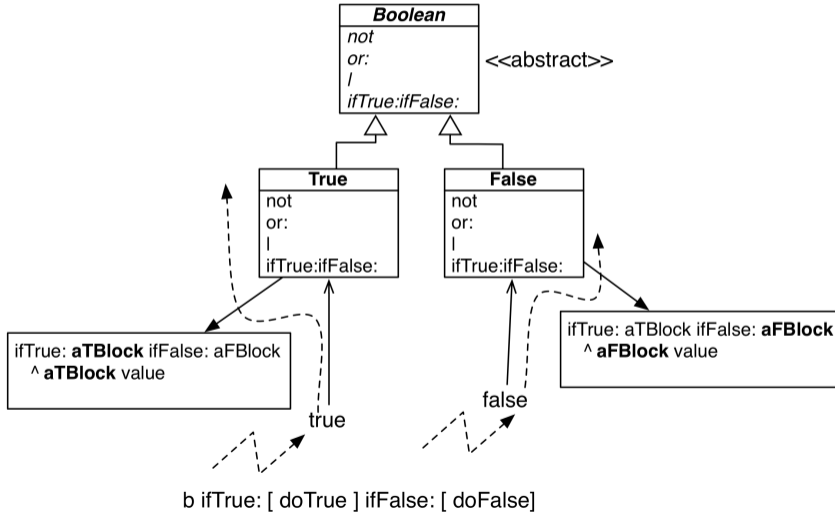

Implementation of ifTrue:ifFalse:

Let the receiver decide!

```
True >> ifTrue: aTrueBlock ifFalse: aFalseBlock  
      ^ aTrueBlock value
```

```
False >> ifTrue: aTrueBlock ifFalse: aFalseBlock  
      ^ aFalseBlock value
```

Implementation of ifTrue:ifFalse:

Conclusion

- Sending a message selects the right method
- Let the receiver decide
- [] freezes computation and value forces execution
